

CLIENT DELIVERY / 22 SEPTEMBER 2026

Software Test Summary Report

DecodeMyBrain application

Review outcome: Validation incomplete - action required

The current automated regression run completed with 131 passing tests and one execution error. Account access, registration, assessment continuation, organisation access and administrative workflows passed their implemented checks. Payment-recording validation remains open because the local database lacks a required invoice field.

Executed	Passed	Errors	Skipped
132	131	1	0

99.24% test pass rate | 559 assertions | 7.13 seconds elapsed

Decision for the client

The report is ready for review. Unconditional release sign-off is not recommended on this evidence alone. Close issue DMB-QA-001, rerun regression testing, and complete the agreed deployment-environment acceptance checks before release approval.

Document control

Field	Value
Report ID / version	DMB-QA-2026-09-22 / 1.0
Project / audience	DecodeMyBrain / client stakeholders and delivery team
Report and execution date	22 September 2026
Build reference	6a648882adde556db28b6d0c87e90f86ebbf023b
Validation environment	Local application checkout; MySQL and selected in-memory SQLite fixtures
Approval state	Issued for review; client acceptance and release approval pending

This document incorporates the previous QA PDF and a fresh automated test run. It reports observed software behaviour; it does not certify the scientific validity of assessment scores or claim conformance to a formal testing standard.

01 / Scope and test approach

Existing unit and application feature tests were executed against the current checkout. Feature tests exercise Laravel routes, controllers, sessions, validation and persistence without a browser. Selected payment, email and ownership tests use fakes or controlled responses; their passing results do not establish live provider delivery.

Business area	Evidence in this run	Coverage boundary
Registration and account access	Signup, duplicate handling, phone/date validation, OTP and legacy password compatibility.	Automated application checks; actual inbox delivery not verified.
Plans and public journey	Plan eligibility, catalogue display, access choice and purchase gates.	Server-rendered output and routing; visual/device checks pending.
Payments and invoices	Checkout ownership, entitlement lifecycle, duplicate recording and invoice retry logic.	One MySQL recording error; live Stripe payment and webhook delivery not verified.
Assessments and results	Saved progress, continuation and answer ownership.	Full questionnaire, score accuracy and final assessment PDF not tested in this run.
Organisation and vouchers	Seat claims, age rules, code validation, voucher usage and enquiry/agreement flows.	Selected implemented cases; exhaustive rule combinations not measured.
Administration	Access restriction, customer visibility, pricing and commercial controls.	Automated selected pages; full user-360 result accuracy requires UAT.

Execution environment and controls

PHP 8.3.32; Laravel 10.39.0; PHPUnit 10.5.5; configuration: laravel-app/phpunit.xml. The application uses a local MySQL database. Selected test classes build in-memory SQLite schemas. Test fixtures use transaction rollback and/or targeted cleanup as implemented by the existing suite. No application code or database migrations were changed for this report.

An initial sandbox-restricted attempt could not connect to MySQL. It was superseded by the completed run with local database access; those connection errors are excluded from the final totals. The remaining error occurred after database connectivity was available.

Historical evidence

The 3 September PDF states that targeted registration and email-verification journeys passed, but supplies no execution count. A separate HTML/Markdown report states 106 tests and 429 assertions passed on that date. These are historical claims, not current results. Current inventory is 132 cases; the difference is not a measured increase in requirements coverage.

02 / Automated execution results

All 132 discovered cases were attempted: 27 unit cases passed; 104 of 105 feature cases passed, with one error. There were no assertion failures or skipped cases in the JUnit record. The CLI groups the single execution error under its “failed” total.

Test group	Run	Pass	Error
Unit / Example	1	1	0
Unit / Otp Service	6	6	0
Unit / Package Catalog	6	6	0
Unit / Stripe Price Manager	4	4	0
Unit / Voucher Service	2	2	0
Unit / Wp Hash Service	8	8	0
Feature / Admin Commercial Workflow	11	11	0
Feature / Admin Insights Pages	2	2	0
Feature / Admin User Management Visibility	1	1	0
Feature / Assessment Resume	4	4	0
Feature / Checkout And Login Ownership	10	10	0
Feature / Example	1	1	0
Feature / Landing Programs	2	2	0
Feature / Native Login Compatibility	3	3	0
Feature / Native Registration	19	19	0
Feature / Organization Code Service	8	8	0
Feature / Otp Flow	6	6	0
Feature / Pay First Gate	8	8	0
Feature / Payment Invoice	3	3	0
Feature / Permanent Voucher Database	1	1	0
Feature / Plan Age Eligibility	2	2	0
Feature / Public Access Choice	2	2	0
Feature / Public Plan Selection	3	3	0
Feature / Registration Access Flow	7	7	0
Feature / Stripe Webhook Entitlement	12	11	1

Pass rate = 131 / 132. Counts include one unit scaffold assertion and one application-response smoke test; these are not separate business requirements. No code-coverage percentage was collected. The appendix lists each executed case.

03 / Open issue and retest plan

Field	Finding
Issue ID / status	DMB-QA-001 / Open
Title	Payment-recording test errors on missing invoice database field
Priority / severity	High / provisional Major: the payment-recording path is affected in the tested local environment. Deployed-environment impact is unverified.
Affected test	StripeWebhookEntitlementTest::test_paid_checkout_is_recorded_once_with_customer_and_package
Expected result	A confirmed payment is recorded once with the correct registered customer and package; replay does not create a duplicate.
Actual result	MySQL rejects the payment-record insert: Unknown column 'invoice_data' in 'field list' (SQLSTATE 42S22).
Evidence	regression-verified.xml and regression-verified.log; one execution error.
Likely cause	Local schema is behind the current application code. The repository contains a migration adding invoice_data and invoice_sent_at. Migration status has not been independently confirmed.
Suggested owner	Application / database delivery owner; assignment pending.

Resolution and verification

1. Confirm the target environment, migration history and required invoice columns.
2. Apply the existing invoice migration through the normal deployment process where missing.
3. Rerun the affected payment test, then the full regression suite.
4. Verify a successful test-mode payment, duplicate webhook replay and invoice receipt in the intended acceptance environment.
5. Attach the new evidence and revise the report outcome only after those checks pass.

Relevant migration: 2026_09_19_000001_add_invoice_delivery_to_payment_records.php. No schema correction was applied during preparation of this report.

Interpretation

The three isolated invoice tests passed, including PDF attachment creation and retry behaviour. Those tests create their own SQLite schema. Their result does not resolve the missing field in the MySQL integration path. This finding is a local validation blocker, not evidence of a confirmed production incident.

No other errors were reported by this execution. A repository-wide defect inventory, security audit and external issue tracker review were not performed.

04 / Client acceptance and release gates

The following checks remain **Not executed** in this report. They form a proposed client UAT checklist; retain results and evidence against each ID before approval.

ID / area	Acceptance criterion	Proposed owner
UAT-01 / Purchase	Register an eligible user; pay in Stripe test mode; verify the correct account, plan, transaction and assessment access.	QA + client
UAT-02 / Messaging	Receive registration OTP, recovery email and payment invoice in the intended inbox; confirm links and attachment open.	QA
UAT-03 / Assessment	Complete a representative assessment; compare scoring against an approved reference; open and download the final report.	Client + QA
UAT-04 / Organisation	Process an enquiry and agreement, activate a code, claim a seat and verify limits and admin visibility.	Client + QA
UAT-05 / Administration	Reconcile a user's plan, payment, status, results and scores across the admin screens.	Client
UAT-06 / Browser and mobile	Complete primary flows on agreed desktop/mobile browsers; check layout, keyboard use, error states and navigation.	QA + client
UAT-07 / Recovery	Verify declined/cancelled payment, interrupted assessment, repeated callbacks and invoice retry without duplicate access or charges.	QA
UAT-08 / Deployment	Confirm migrations and configuration; validate signed webhooks, access controls and operational monitoring in the acceptance environment.	Delivery owner

Exit criteria

Close DMB-QA-001 and obtain a clean regression run with no unexplained skips. Complete the agreed UAT cases with retained evidence. Triage any newly found issues and record accepted residual risks. Obtain named client and delivery-owner approval for the exact deployed build.

Additional assurance outside this run

Load/performance, penetration testing, comprehensive accessibility compliance, backup/restore and broad cross-device testing were not executed. Agree their required depth before release; no assurance for these areas is implied by the automated pass rate.

Approval record

Role	Name / decision / date
QA reviewer	Pending
Delivery owner	Pending
Client authorised approver	Pending

05 / Evidence and traceability

Reference	Use in this report
E01 - Previous QA PDF	DecodeMyBrain-Targeted-QA-Validation-2026-09-03.pdf; historical targeted validation only.
E02 - Previous regression summary	QA_Test_Completion_Report_2026-08-17.html and .md; internal validation date is 3 September 2026 despite filename. Historical 106-test claim.
E03 - Delivery scope	DecodeMyBrain-Project-Plan-2-updated.pdf and DecodeMyBrain-Deliverables-v2.8.pdf; context for register/pay/assess/report and administration scope. Planning statements are not test evidence.
E04 - Current execution	evidence/regression-verified.xml; authoritative per-case results, assertion counts and errors.
E05 - Runner transcript	evidence/regression-verified.log; CLI summary: 131 passed, 1 failed, 559 assertions, 7.13 seconds.
E06 - Test implementation	laravel-app/tests/Unit and tests/Feature at build 6a648882adde556db28b6d0c87e90f86ebbf023b.
E07 - Schema evidence	Invoice migration dated 19 September 2026 adds the fields used by the failing payment-recording path.

Reproduction

From laravel-app, run:

```
php artisan test --log-junit=../reports/qa-2026-09-22/evidence/regression-verified.xml
```

The results reflect the local database state at execution. A repeat run can differ if application data, configuration or schema changes. Feature cases use synthetic fixture identities and controlled provider responses where implemented.

Evidence integrity
